

Koltek Traversing Gantries

Manually operated or run by electric trolleys

Traversing gantries may be manually operated or run by electric trolleys. When manually operated the gantry will slide easily in the direction it is pushed. Each gantry may be equipped with an operating brake* which can be used to hold the gantry in the operators desired working position.

The gantry is designed to travel on Koltek aluminum tracks. As standard both the track profiles and the gantry is delivered natural anodized. The gantry may be straight, horizontal or elevated in one end, it can be telescopic or curved to fit the profile of the roof or the room. Our design engineers will give more information on request.

- Contact a Koltek® representative for more info.

*The operating brake shall not be used as parking brake when the gantry is not in use. You must include a separate chain/steel rope with padlock to secure the gantry when stored.
